A 64-YEAR-OLD diabetic, hypertensive, obese woman came to the emergency department with a 5-day history of diffuse abdominal cramps. Two weeks prior, she reported an episode of acute right upper quadrant pain lasting a few hours and associated with nausea and vomiting. She had watery diarrhea during the last 2 days and 1 episode of nonbilious emesis the morning of admission. Her abdomen was soft and nontender but moderately distended. The findings on rectal examination were unremarkable. Further testing was performed (Figure 1).

What Is the Diagnosis?

A. Fecalith
B. Gallstone ileus
C. Bezoar
D. Volvulus
